ACCOUNTING AND FINANCE ATAR COURSE SPECIFICATIONS BOOKLET

2021

## Calculation for depreciation

## Straight-line method

$$
\begin{array}{ll}
\begin{array}{l}
\text { Depreciation expense } \\
\text { per annum }
\end{array} & =\frac{\text { Original cost - Residual value }}{\text { Useful life }} \\
& \text { or } \\
& =\frac{\text { Depreciable amount }}{\text { Useful life }}
\end{array}
$$

## Reducing/Diminishing balance method

Depreciation expense $\quad=$ Carrying amount $\times$ Depreciation rate
Carrying amount = Original cost - Accumulated depreciation

## Preparation of ratios

Results from calculations may be presented either as a percentage or as a ratio, to two decimal places.

| Ratio | Method of calculation |
| :---: | :---: |
| Profit | $\underline{\text { Profit (after income tax) }{ }^{\text {A }}}$ |
|  | Total revenue |
| Debtor's collection | $\frac{\text { Average debtors }}{\text { Net credit sales }} \text { B } \times 365$ |
| Inventory/stock turnover | Cost of sales ${ }^{\text {c }}$ |
|  | Cost of average inventory |
| Debt to equity | Total liabilities |
|  | Equity (end) |
| Working capital/current | Current assets |
|  | Current liabilities |
| Quick asset | Current assets (excluding inventory and prepayments) |
|  | Current liabilities (excluding bank overdraft) |
| Rate of return on assets | Profit before income tax + Interest expense |
|  | Average total assets |
| Times interest earned | $\underline{\text { Profit before income tax + Interest expense }}$ |
|  | Interest expense |
| Earnings per share | Profit (after income tax) |
|  | $\overline{\text { Weighted average number of ordinary shares issued }}$ |
| Price/earnings | Market price per ordinary share |
|  | Earnings per share |
| Dividend yield | Annual dividend per ordinary share |
|  | Market price per ordinary share |

A: Income tax is to be charged at the specified company rate
B: Net sales = Sales revenue - Sales returns and allowances - Discount allowed
C: Cost of sales (total) = Cost of sales (account) + Import duties + Freight inwards - Discount received

## Cost accounting and variance analysis

| Standard cost per |
| :--- |
| unit |

| Predetermined |
| :--- |
| overhead recovery |
| rate |

| Standard input quantity |
| :--- |
| Cost of |
| allowed per output unit |

| Total estimated manufacturing overheads |
| :--- |

Total estimated allocation base $\quad$| Selling/quotation price per input unit |
| :--- |
| price |

## Direct material variances

| Price variance | $=(A P-S P) \times A Q P$ <br> i.e. (Actual price of input - Standard price of input) $\times$ Actual quantity of input purchased |
| :---: | :---: |
| Usage variance | $=(A Q I-S Q A) \times S P$ <br> i.e. (Actual quantity of input Issued - Standard quantity of input allowed for actual output) $\times$ Standard price of input |
| where SQA | $\begin{aligned} &= S Q \times A O \\ & \text { i.e. Standard quantity per unit } \times \text { Actual output in units produced } \end{aligned}$ |

## Direct labour variances

Rate variance $=(A R-S R) \times A D L H$
i.e. (Actual rate per direct labour hour worked - Standard rate per direct labour hour worked) $\times$ Actual direct labour hours worked

```
Efficiency variance \(=(\) ADLH - SDLHA \() \times\) SR
    i.e. (Actual direct labour hours worked - Standard direct labour hours
    allowed for actual output) \(\times\) Standard rate per direct labour hour
where SDLHA \(=\) SDLH \(\times\) AO
    i.e. Standard direct labour hours allowed per unit \(\times\) Actual output in units
    produced
```

## Cost volume profit analysis for profit planning

## Standard abbreviations include:

FC = Fixed costs
OC = Opportunity costs
QS = Quantity sold or budgeted
SP = Selling price
TC = Total costs
TFC = Total fixed costs
TVC $=$ Total variable costs
TR = Total revenue
VC = Variable costs

## Basic cost profit concepts

Profit $=T R-T C$
Profit $=(S P \times Q S)-[(V C \times Q S)+T F C]$
TC = TVC + TFC
Unit cost $=\frac{T C}{\text { Number of units }}$

## Calculation of contribution margin

Contribution margin per unit = SP per unit - VC per unit
or
Total contribution margin $=$ TR - TVC
or
Contribution margin ratio $=\frac{\text { Contribution margin per unit }}{\text { SP per unit }}$

## Break-even point for a single product firm

$$
\begin{aligned}
& \text { Break-even point (in units) } \\
& \text { or } \\
& \text { Break-even point (in sales dollars) }
\end{aligned}=\frac{\text { TFC }}{\text { Contribution margin per unit }}=\frac{\text { TFC }}{\text { Contribution margin ratio }}
$$

Break-even point in total units in multi-product firm
Break-even point (in units) $=\frac{\text { TFC }}{\text { Weighted average contribution margin per unit }}$

## Weighted average contribution margin

| Weighted average |
| :--- |
| contribution margin |
| per unit |$\quad \sum$ (Contribution margin per unit $\times$ Sales mix \%)

where $\sum$ means the sum of a set of numbers

Sales mix \% $\quad=\frac{\text { number of units sold of a given product }}{\text { total units sold of all products }} \times 100$

## Forecast revenue for target profit

$\underset{\text { (in sales dollars) }}{\text { Forecast revenue }}=$ TVC + TFC + Target profit
$\begin{aligned} & \text { Forecast target } \\ & \text { revenue (in units) }\end{aligned} \quad=\frac{\text { TFC }+ \text { Target profit }}{\text { Contribution margin per unit }}$

## Margin of safety

Margin of safety $=$ Actual or budgeted sales - break-even sales
Margin of safety \% = $\frac{\text { Margin of safety in dollars }}{\text { Total actual/budgeted sales }} \times 100$

## Special order

Gain/Loss $\quad=(S P \times Q S)-(V C \times Q S)-$ new FC - OC i.e. Special order income - Special order variable costs - New or additional fixed costs - Opportunity costs
where OC $=$ Units forgone in usual production $\times$ Usual contribution margin

## Capital investment/budgeting

## Net present value (NPV) method (time value of money)

Present value of $\$ 1$ at the end of future periods

| Periods | $\mathbf{2 \%}$ | $\mathbf{3 \%}$ | $\mathbf{4 \%}$ | $\mathbf{5 \%}$ | $\mathbf{6 \%}$ | $\mathbf{7 \%}$ | $\mathbf{8 \%}$ | $\mathbf{9 \%}$ | $\mathbf{1 0 \%}$ | $\mathbf{1 2 \%}$ | $\mathbf{1 4 \%}$ | $\mathbf{1 6 \%}$ |

## Net present value (NPV)

| Present value | $=$ | $\frac{\text { Net cash flow }}{(1+\mathrm{i})^{n}}$ |
| ---: | :--- | :--- |
| where i | $=$ |  |
| n Interest rate |  |  |
| n | $=$ | Number of periods |
| NPV |  |  |
|  |  |  |

## Payback period

Where annual net cash flows are constant:
Payback period $=\frac{\text { Initial cost of investment }}{\text { Annual net cash flow }}$
Results from calculations are to be presented in years and months.
